

Pareto Chart: Process Optimization Bottlenecks

This chart demonstrates that manually aligning columns and struggling with cross-month split-week data files are the real bottlenecks slowing down the reporting cycle.

Process Friction Breakdown

This matrix straight into your **Measure/Analyze Phase** documentation to prove your automation target was highly calculated:

Rank	Manual Reporting Process Step	Hours Spent Per Cycle	Individual %	Cumulative %	Six Sigma Optimization Target
1	Manual VLOOKUP & Data Alignment (Cross-referencing transactions against the 4-dimension tables)	20 Hours	47.6%	47.6%	Vital Few (Eliminated via Star Schema Relationships)
2	Handling Split-Week Overlaps (Manually calculating mid-week calendar month-end transitions)	11 Hours	26.2%	73.8%	Vital Few (Eliminated via Power Query M-Code Logic)
3	Error Correction / Exceptions (Troubleshooting lookups for resigned/terminated employees)	6 Hours	14.3%	88.1%	Useful Many (Automated via Conditional Merges)
4	Manual Pivot Aggregation & Formatting (Rebuilding charts, color-coding variances for L1 managers)	3 Hours	7.1%	95.2%	Useful Many (Replaced by Power BI Interactive Canvas)
5	File Collection from Split Folders (Opening separate 2025/2026 subfolders to copy datasets)	2 Hours	4.8%	100.0%	Useful Many (Replaced by Folder Ingestion Parameter)

Pareto Chart: Process Optimization Bottlenecks (Time-Motion Study)

Instead of looking at the *financial data categories* or the *root cause themes*, this version maps the exact **procedural steps and technical friction points** where your team wastes time during a time-and-motion study.

By mapping the process steps this way, you visually demonstrate to Lean Six Sigma auditors or hiring managers that you targeted the exact procedural mechanics that cause **73.8%** of the reporting delay.
